## PRACTICE EXAM #4 (Ch. 7-9)

ChemV12A, Organic Chemistry I

1.) Propose a synthesis and clearly describe the reactions and reagents needed to convert the following reactants to their indicated products. (40 pts, 20 pts ea)

2.) Which is more stable: a vinylic or an allylic carbocation? Why? (11 pts)

 $_{>}CH_{2}^{+}$ R′

vinylic

allylic

3.) Show the arrow-pushing mechanisms for the following reactions including correct **stereochemistry** (wedges/dashes, cis/trans) if applicable. (40 pts, 20 pts ea)

4.) Draw the line-angle structures for: (10 pts, 5 pts ea)a.) 4-methyl-2-hexyne

b.) pent-1-en-4-yne

5.) Give the structures of the **major** product(s) for the following compounds. If there is both a **kinetic** and **thermodynamic** product, show <u>both</u> and clearly <u>label</u> each. Show <u>both</u> **tautomers** if keto/aldo-enol tautomerization is present. (32 pts, 8 pts ea)

6.) For each of the following substitution reactions, state whether they are more likely to undergo **SN1** or **SN2** mechanisms and **why**. Then show the **mechanism** and the **major** product(s), including correct **stereochemistry** (wedges and dashes). If the products are **chiral**, <u>label</u> them R or S appropriately. (32 pts, 16 pts ea)
