## Kinetics <br> Chem1B, General Chemistry II

Learning Outcomes: By the end of this chapter you should be able to:
(1) Predict the effect of physical state, concentration, temperature, a catalyst, molecular orientation, and kinetic energy on the rate of a reaction.
(2) Use the given rate law for a reaction to solve for any variable in the equation (rate, rate constant, order, or concentration).
(3) Use the method of initial rates to determine the order ( $0^{\text {th }}, 1^{\text {st }}$, or $\left.2^{\text {nd }}\right)$ of reaction for any reactant and determine the value for the rate constant.
(4) Use graphs of time versus concentration to determine whether a reaction is $0^{\text {th }}$, $1^{\text {st }}$, or $2^{\text {nd }}$ order and use their integrated rate laws.
(5) Calculate the half-life for a $0^{\text {th }}, 1^{\text {st }}$, or $2^{\text {nd }}$ order reaction.
(6) Use all versions of the Arrhenius Equation to solve for its values.
(7) Use a complete mechanism to determine the overall rate law for a reaction.
(8) Label a reaction coordinate diagram for single or multistep reactions.

## Equations and Constants

$$
\begin{aligned}
& {[\mathrm{A}]_{\mathrm{t}}=-\mathrm{kt}+[\mathrm{A}]_{0}} \\
& \ln [\mathrm{~A}]_{\mathrm{t}}=-\mathrm{kt}+\ln [\mathrm{A}]_{0} \\
& \frac{1}{[\mathrm{~A}]_{\mathrm{t}}}=\mathrm{kt}+\frac{1}{[\mathrm{~A}]_{0}} \\
& \mathrm{t}_{1 / 2}=\frac{-\ln (0.5)}{\mathrm{k}} \approx \frac{0.693}{\mathrm{k}} \\
& \mathrm{t}_{1 / 2}=\frac{1}{\mathrm{k}[\mathrm{~A}]_{0}} \\
& \mathrm{k}=\mathrm{Ae} \\
& \mathrm{R}=\text { universal gas constant, } 8.314 \mathrm{ln}(\mathrm{k})=-\frac{\mathrm{E}_{\mathrm{a}}}{\mathrm{RT}}+\ln (\mathrm{A}) \\
& \ln \left(\frac{\mathrm{k}_{1}}{\mathrm{k}_{2}}\right)=\frac{\mathrm{E}_{\mathrm{a}}}{\mathrm{R}}\left(\frac{1}{\mathrm{~T}_{2}}-\frac{1}{\mathrm{~T}_{1}}\right)
\end{aligned}
$$

## (1) Introduction to Kinetics

Kinetics studies how fast reactions progress

- How do we define rate?
- What units is rate usually in?

There are six main factors that affect (speed up/slow down) the rate of a reaction.

- What are they?
- Briefly describe how and why each affects reaction rate.

## (2) Rate Laws

The rate of a reaction can be calculated for any given reactant or product.

- What is the key difference between the rate of reaction for a reactant versus a product?
- In your own words, describe initial rate, instantaneous rate, and average rate. How are they the same? How are they different?

Stoichiometric coefficients must be included when calculating rate.

- In your own words, describe how to account for stoichiometry in reaction rates.

Ex. 1) The following data was collected from the reaction:

$$
2 \mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{Sn}^{2+}(\mathrm{aq}) \rightarrow 2 \mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{Sn}^{4+}(\mathrm{aq})
$$

| Time (s) | 0 | 30 | 60 |
| :---: | :---: | :---: | :---: |
| $\left[\mathrm{Fe}^{3+}\right]$ | 0.100 | 0.050 | 0.025 |

a.) Find the average rage for $\left[\mathrm{Fe}^{3+}\right]$.
b.) Assuming the rate in (a) is constant, calculate $\left[\mathrm{Fe}^{3+}\right]$ at $\mathrm{t}=75 \mathrm{sec}$.
c.) Find the average rate of $\left[\mathrm{Fe}^{2+}\right]$.
d.) Find the average rate of $\left[\mathrm{Sn}^{4+}\right]$.

Rate laws are equations used to express the speed of a particular reaction.

- Write the generic form of a rate law for a reaction. Define each term.
- What are three orders of reaction we will be discussing?

Ex. 2: For $A \rightarrow$ products, use the following data to answer the questions.

| $[\mathrm{A}]$ | 2.50 | 0.833 |
| :---: | :---: | :---: |
| Rate (M/s) | 0.625 | 0.0692 |

a.) Determine the order of the reaction with respect to $A$.
b.) Find the rate constant, including units.

## (3) The Method of Initial Rates

The method of initial rates varies the concentration of reactants and measures their initial rates over a series of experiments.

Ex. 3) The following data was collected from the reaction:

$$
2 \mathrm{HgCl}_{2}+\mathrm{C}_{2} \mathrm{O}_{4}^{2-} \rightarrow 2 \mathrm{Cl}^{-}+2 \mathrm{CO}_{2}+\mathrm{Hg}_{2} \mathrm{Cl}_{2}
$$

| Exp. | $\left[\mathbf{H g C l}_{\mathbf{2}}\right]$ | $\left[\mathbf{C}_{\mathbf{2}} \mathbf{O}_{\mathbf{4}}{ }^{\mathbf{2 -}}\right]$ | Rate |
| :---: | :---: | :---: | :---: |
| 1 | 0.105 | 0.15 | $1.8 \times 10^{-5}$ |
| 2 | 0.105 | 0.30 | $7.1 \times 10^{-5}$ |
| 3 | 0.052 | 0.30 | $3.5 \times 10^{-5}$ |

a.) Determine the rate law.
b.) Calculate $k$, including units.

Ex. 4) The following data was collected from the reaction:

$$
2 \mathrm{NO}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NOCl}(\mathrm{~g})
$$

| Exp. | [NO] | [Cl2] | Rate |
| :---: | :---: | :---: | :---: |
| 1 | 0.0125 | 0.0255 | $2.27 \times 10^{-5}$ |
| 2 | 0.0125 | 0.0510 | $4.55 \times 10^{-5}$ |
| 3 | 0.0250 | 0.0255 | $9.08 \times 10^{-5}$ |

a.) Determine the rate law.
b.) Find the value of $k$, including units, from Experiment 2.
c.) Which reaction will progress faster: $2 \mathrm{HgCl}_{2}+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}$ or $2 \mathrm{NO}+\mathrm{Cl}_{2}$ ? Explain.

## (4) Integrated Rate Laws

Zeroth, first, and second order rate laws can be integrated (linearized) to create straight-line graphs.

- Write the integrated rate laws for zeroth, first, and second order reactions. How are they the same? How are they different?
- Describe the graphs for zeroth, first, and second order reactions. What is on the $y$-axis? The x-axis? What in the integrated rate laws does the slope represent? The y-intercept? Using only graphs, how could you determine the order of the reaction? How could you use this in lab?

| Zero Order Reaction |  |  |
| :--- | :---: | :--- |
| $2 \mathrm{NH}_{3}(\mathrm{~g})$ | $-->\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g})$ |  |
|  |  |  |
| Time | $\left[\mathrm{NH}_{3}\right]$ |  |
| $\mathbf{( s )}$ | $\mathbf{( M )}$ |  |
| 0 | 1.85 |  |
| 10 | 1.65 |  |
| 25 | 1.35 |  |
| 45 | 0.95 |  |
| 60 | 0.65 |  |
| 90 | 0.05 |  |

First Order Reaction

| $\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq})$ | $-->\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+1 / 2 \mathrm{O}_{2}(\mathrm{~g})$ |  |
| :---: | :---: | :---: |
|  |  |  |
| Time | $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]$ | $\ln \left(\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\right)$ |
| $\mathbf{( s )}$ | $\mathbf{( M )}$ |  |
| 0 | 2.32 | 0.8415672 |
| 200 | 2.01 | 0.6981347 |
| 400 | 1.72 | 0.5423243 |
| 600 | 1.49 | 0.3987761 |
| 1200 | 0.98 | -0.0202027 |
| 1800 | 0.62 | -0.4780358 |
| 3000 | 0.25 | -1.3862944 |

| Second |  |  |
| :---: | :---: | :---: |
| $2 \mathrm{NO}_{2}(\mathrm{~g})$ | --> $2 \mathrm{NO}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g})$ |  |
|  |  |  |
| Time | $\left[\mathbf{N O}_{2}\right]$ | $1 /\left[\mathrm{NO}_{2}\right]$ |
| $(\mathbf{s})$ | $(\mathbf{M})$ |  |
| 0 | 0.1 | 10 |
| 5 | 0.017 | 58.823529 |
| 10 | 0.009 | 111.11111 |
| 15 | 0.0062 | 161.29032 |
| 20 | 0.0047 | 212.76596 |

Ex. 5) For $\mathrm{A} \rightarrow$ products, find $[\mathrm{A}]$ at $\mathrm{t}=2.50$ minutes for a second-order reaction when $[\mathrm{A}]_{0}=3.50 \mathrm{M}$ and $\mathrm{k}=0.0168 \mathrm{M}^{-1} \mathrm{~s}^{-1}$.

## (5) Half-Life

The half-life is defined as the amount of time required for the initial concentration of reactant to decrease to half its original amount.

- Write the equations for the half-life of zeroth, first, and second order reactions. How are they the same? How are they different?

Ex. 6) The decomposition of $\mathrm{H}_{2} \mathrm{O}_{2}$ is first-order: $2 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq}) \rightarrow \mathrm{O}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}$ (I)
a.) Calculate $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]$ at $\mathrm{t}=132 \mathrm{~s}$ if the initial concentration of $\mathrm{H}_{2} \mathrm{O}_{2}$ was 3.61 M and the rate constant $(\mathrm{k})$ is $7.30 \times 10^{-4} \mathrm{~s}^{-1}$.
b.) Calculate the half-life ( $\mathrm{t}_{1 / 2}$ ) for the decomposition of $\mathrm{H}_{2} \mathrm{O}_{2}$, using the above value of $k$.

Ex. 7) Calculate the half-life of a second order reaction when $[\mathrm{A}]_{0}=1.00 \mathrm{M}$ and $\mathrm{k}=$ $0.002 \mathrm{M}^{-1} \mathrm{~s}^{-1}$.

Ex. 8) For a second order reaction at $t=300$ seconds, $[A]_{\mathrm{t}}=0.63 \mathrm{M}$ and $[\mathrm{A}]_{0}=1.00 \mathrm{M}$. a.) Calculate $k$, including units.
b.) Determine the half-life ( $\mathrm{t}_{1 / 2}$ ) for the above reaction.

## (6) The Arrhenius Equation

The Arrhenius Equation can be used for any order reaction and includes its dependence on temperature.

- Write all three forms of the Arrhenius Equation. Define each term. When would you use which?

Ex. 9) At 298 K , a first order reaction has a rate constant (k) of $3.46 \times 10^{-5} \mathrm{~s}^{-1}$. Calculate T when $\mathrm{t}_{1 / 2}=2 \mathrm{hrs}$. and the activation energy $\left(\mathrm{E}_{\mathrm{a}}\right)$ is $106 \mathrm{~kJ} / \mathrm{mol}$.

## (7) Mechanisms

Mechanisms break reactions down into their single steps.

- What is molecularity? When can it be used to determine rate laws?

Ex. 10) Determine the rate law for: $2 \mathrm{NO}+\mathrm{O}_{2} \rightarrow 2 \mathrm{NO}_{2}$
$2 \mathrm{NO} \rightleftharpoons \mathrm{N}_{2} \mathrm{O}_{2}$
fast
$\mathrm{N}_{2} \mathrm{O}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{NO}_{2}$ slow

Ex. 11) Determine the raw law for: $\mathrm{NH}_{4}{ }^{+}+\mathrm{HNO}_{2} \rightarrow \mathrm{~N}_{2}+2 \mathrm{H}_{2} \mathrm{O}+\mathrm{H}^{+}$

$$
\begin{array}{ll}
\mathrm{HNO}_{2}+\mathrm{H}^{+} \rightleftharpoons \mathrm{H}_{2} \mathrm{O}+\mathrm{NO}^{+} & \text {fast } \\
\mathrm{NH}_{4}^{+} \rightleftharpoons \mathrm{NH}_{3}+\mathrm{H}^{+} & \text {fast } \\
\mathrm{NO}^{+}+\mathrm{NH}_{3} \rightarrow \mathrm{NH}_{3} \mathrm{NO}^{+} & \text {slow } \\
\mathrm{NH}_{3} \mathrm{NO}^{+} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{H}^{+}+\mathrm{N}_{2} & \text { fast }
\end{array}
$$

## (8) Reaction Coordinate Diagrams

Reaction Coordinate Diagrams graph the energy of a reaction ( $y$-axis) against the reaction progress ( x -axis).

Ex. 12) Draw two reaction coordinate diagrams for an exothermic, single-step reaction (1) with and (2) without a catalyst. Label all important features.

Ex. 13) Draw a reaction coordinate diagram for an endothermic, two-step reaction without a catalyst. Label all important features.
