1.) Both $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}\left(\mathrm{K}_{\mathrm{a}}=4.2 \times 10^{-13}\right)$ and $\mathrm{HSO}_{3}^{-}\left(\mathrm{K}_{\mathrm{a}}=6.2 \times 10^{-8}\right)$ are amphiprotic (amphoteric). Write out the expected equilibrium formed between these compounds, clearly indicating which will behave as the acid and which as the base.
Since $\mathrm{HSO}_{3}^{-}$has a higher Ka , it is the stronger acid and will donate the proton to $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$
$\mathrm{HSO}_{3}{ }^{-}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{PO}_{4}^{-}(\mathrm{aq}) \leftrightarrow \mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{PO}_{4}(\mathrm{aq})$

Assume complete heat transfer from the ice to the surrounding air.

$\Delta \mathrm{S}_{\text {sys }}=(6.1 \underline{14 \mathrm{~kJ}}) / 273 \mathrm{~K}=0.022 \underline{3} 9 \mathrm{~kJ} / \mathrm{K}$
